 REPORT (VERIFIED 2005/09/26)

CT CHEST

HISTORY: Uterus cancer. Followup.

TECHNIQUE: A helical CT of the chest has been performed with 5-mm overlapping slices, following intravenous contrast injection.

COMPARISON STUDY: Comparison is made with the previous examination from 3 May 2005.

FINDINGS: There are no pathologically enlarged mediastinal or hilar lymph nodes. Heart is normal. Normal caliber of the aorta and pulmonary arteries. The pleural surfaces are clear.

There are no enlarged axillary lymph nodes, no focal pathology seen in the chest wall. The abdomen will be reported separately

The tracheobronchial tree remains patent.

The right lung is clear.

Left upper lobe is clear. A mild atelectasis in the lingula inferiorly. The previously seen focal consolidation in the left lower lobe is not visible on today's exam. No new abnormality.

The chest bones remain intact.

IMPRESSION: Interval resolution of the previously seen opacity in the left lower lobe, no convincing evidence of metastases.
